Abstracts

Viscose-based carbon fiber is a high-performance material manufactured through the controlled pyrolysis of regenerated cellulose (viscose) fibers, resulting in a carbon-rich structure characterized by its low density, high specific strength, excellent thermal stability, and notable resistance to oxidation and corrosion. Unlike carbon fibers derived from polyacrylonitrile (PAN) or petroleum pitch, viscose-based variants are valued for their bio-based origin, relatively low thermal conductivity, and suitability for applications requiring high-temperature insulation or ablative properties, though they generally exhibit lower tensile strength compared to PAN-based alternatives.

The global Viscose Based Carbon Fiber market size was estimated at USD 150.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
