Abstracts

Visible Active Grille Shutters (VAGS) are electronically controlled louvers located within the front grille of a vehicle. Unlike Non-Visible Active Grille Shutters (NVAGS), these shutters can be seen directly through the grille slats, making them a more noticeable component of a vehicle's design. Governments around the world are introducing increasingly stringent fuel efficiency and emissions regulations to combat climate change and reduce reliance on fossil fuels. This has created a significant need for technologies that reduce vehicle fuel consumption and CO₂ emissions. Advancements in Automotive Technology and Smart Systems, smart systems and advanced driver-assistance systems (ADAS) are becoming increasingly integrated into modern vehicles. These technologies can optimize vehicle performance, including adjusting the grille shutter in real time based on environmental factors, driving conditions, and the vehicle's performance needs. Aerodynamic performance is a critical factor in improving the overall fuel efficiency of vehicles. Reducing air resistance (drag) at high speeds can significantly improve fuel consumption. Active grille shutters automatically adjust to optimize the airflow to the vehicle's engine or cooling system. This makes them a cost-effective and efficient solution for automakers seeking to improve vehicle aerodynamics without major design changes.

The global Visible Active Grille Shutters market size was estimated at USD 1207.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.40% during the forecast period.
