Report Overview

Metalens is a lens developed based on metasurface technology and using micro-nano technology and dielectric materials. Metalenses will completely subvert the cumbersome lens groups in traditional optical devices, realize the original lens functions of several millimeters or even centimeters with a thickness of microns, and integrate the functions of multiple optical elements into one, greatly reducing the size and weight of the imaging system. , simplifying the structure and optimizing performance. Current commercial metalenses are focused on narrowband applications such as near-infrared (NIR), short wavelength infrared (SWIR), and narrowband visible, while broadband technology is being developed.
