Abstracts

Visible opaque dyes (VODs) are specialized colorants engineered to provide high opacity and intense coloration, primarily used in applications where both vivid visual appearance and light-blocking properties are essential, such as in plastics, coatings, inks, and textiles. These dyes are formulated to prevent substrate show-through and ensure consistent, uniform coverage even on dark or varied backgrounds, distinguishing them from conventional transparent dyes or pigments that may require multiple layers or underlying primers to achieve similar effects. Their functionality relies on a combination of strong tinting strength and opacifying agents, often incorporating inorganic compounds like titanium dioxide or other scattering particles to enhance hiding power while maintaining color stability and resistance to fading under environmental exposure.

The global Visible Opaque Dyes (Vod) market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
