## Abstracts

A vitamin immunoaffinity column is an analytical tool used to separate and enrich specific vitamins in samples based on the immunoaffinity principle. Antibodies specific to certain vitamins are immobilized on the packing material in the column. When a sample solution containing the target vitamin passes through the column, the vitamin binds specifically to the immobilized antibodies, while other impurities in the sample flow out directly. Then, the target vitamin bound to the antibodies is eluted with a specific eluent. It's mainly applied in the determination of vitamin content in food, pharmaceuticals, biological samples and other fields.

The global Vitamin Immunoaffinity Column market size was estimated at USD 73.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
