Report Overview:

Volatile organic compounds (VOCs) are organic chemicals that have a high vapour pressure at room temperature. High vapor pressure correlates with a low boiling point, which relates to the number of the sample's molecules in the surrounding air, a trait known as volatility. VOCs are responsible for the odor, scents, and perfumes as well as pollutants. VOCs play an important role in communication between animals and plants, e.g. attractants for pollinators, protection from predation, and even inter-plant interactions. Some VOCs are dangerous to human health or cause harm to the environment. Anthropogenic VOCs are regulated by law, especially indoors, where concentrations are the highest. Most VOCs are not acutely toxic, but may have long-term chronic health effects.

The Global VOCs Processing Facility Market Size was estimated at USD 1623.43 million in 2023 and is projected to reach USD 3415.96 million by 2029, exhibiting a CAGR of 13.20% during the forecast period.
