## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Voice Coil Motor (VCM) Spring Sheets competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Voice Coil Motor (VCM) Spring Sheet (commonly known as suspension springs or flexure springs) are precision-engineered components within camera modules that act as integral elastic supports and conductive pathways for the lens assembly mounted on the voice coil motor (VCM). Typically made from high-performance beryllium copper alloy via precision photo-etching, they provide the mechanical guidance and recovery force needed for the VCM's autofocus function, allowing the lens to move smoothly and precisely along the optical axis while reliably returning it to the neutral position when power is cut. Crucially, they also serve as miniaturized electrical conduits, carrying drive current to the VCM coil and transmitting position feedback signals (like Hall effect sensor data) to the control circuit. Their design balances high stiffness for stability, low resistance for efficient power delivery, long-term fatigue resistance against constant motion, and precisely calibrated elasticity for optimal focus response. They are fundamental to achieving the compact size, low power consumption, rapid focus, and optical stability demanded by modern high-resolution mobile cameras.

The global Voice Coil Motor (VCM) Spring Sheets market size was estimated at USD 129.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
