Voice Search Optimization (VSO) refers to the process of optimizing digital content, websites, and online assets to improve visibility and performance in response to voice-based queries, which are typically executed through virtual assistants like Amazon's Alexa, Google Assistant, Apple's Siri, or Microsoft's Cortana. This discipline involves tailoring content to match natural language patterns, focusing on long-tail keywords, question-based phrases, and conversational queries, as voice searches are often more colloquial and context-driven than text-based searches. VSO also emphasizes technical optimizations such as improving site speed, ensuring mobile responsiveness, and implementing structured data (schema markup) to help search engines better understand and feature content in voice search results, frequently aiming for featured snippets or "position zero," which voice assistants often rely on to deliver concise answers.

The global Voice Search Optimization market size was estimated at USD 6750.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 21.50% during the forecast period.
