Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Volatile Hydride competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Volatile Hydride production reached approximately 13,400 tons, with an average global market price of around US\$ 115,500 per ton. Volatile Hydride refers to a class of chemical compounds composed of hydrogen and a less electronegative element (typically a metalloid or nonmetal), which are characterized by their tendency to exist as gases or easily vaporize at room temperature. These hydrides, such as arsine (AsH₃), phosphine (PH₃), and silane (SiH₄), are notable for their high volatility, allowing them to be transported and introduced in gaseous form during chemical processes. They are commonly used as precursors in semiconductor manufacturing, thin-film deposition, and analytical techniques like hydride generation atomic absorption spectroscopy. Their high toxicity and reactivity require careful handling under controlled conditions.

The global Volatile Hydride market size was estimated at USD 1548.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
