Abstracts

Volatile Organic Compounds (VOCs) refer to a broad class of carbon-based chemicals that easily evaporate at room temperature and participate in atmospheric photochemical reactions, contributing to ozone and secondary organic aerosol formation. They are emitted from a wide range of sources, including industrial solvents, paints, coatings, adhesives, cleaning agents, building materials, vehicle exhaust, and even natural sources like vegetation. The term encompasses both human-made and naturally occurring compounds, such as benzene, formaldehyde, toluene, and xylene, which vary in their chemical properties, toxicity, and environmental impact. Due to their role in air pollution and adverse health effects?including respiratory issues, headaches, and potential carcinogenicity?VOCs are subject to stringent regulatory controls and monitoring across many industries, driving demand for detection, abatement, and low-VOC alternative products.

The global Volatile Organic Compound market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
