Report Overview:

VOC molecules are complex and easily broken down by high energy photons. VOC sensors use a bright ultraviolet light source to knock electrons out of the VOC molecule; the electrons are measured and their flow indicates that VOC molecules are present at the sensor. Each specific type of VOC molecule has an 'ionization potential' (IP) value that represents the amount of energy necessary to liberate an electron; this value is measured in 'electron volts', or eV. PID sensors have a specified level of energy, also measured in eV.

VOCs are commonly monitored as they are a key contributor in photochemical smog. Many are hazardous to human health, with several classified as carcinogenic. The key sources of VOCs are industrial processes (especially those involving solvents) vehicle emissions, evaporative loss from petrol storage and even natural sources like forest fires.

The Global Volatile Organic Compound (VOC) Sensors and Monitors Market Size was estimated at USD 120.35 million in 2023 and is projected to reach USD 155.83 million by 2029, exhibiting a CAGR of 4.40% during the forecast period.
