Abstracts

A Voluntary Milking System (VMS) is an automated robotic milking technology that allows dairy cows to be milked voluntarily and on-demand, without the need for human intervention during the milking process itself. These systems utilize sensors, robotic arms, and data management software to identify individual cows, clean their udders, attach milking cups, monitor milk yield and quality, and detach the equipment once milking is complete, all while enabling cows to choose their own milking schedule within a specified timeframe, typically multiple times per day.

The global Voluntary Milking System market size was estimated at USD 720.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
