## Abstracts

VR Optical Modules are key components in virtual reality (VR) devices. They are responsible for processing and optimizing the images presented on the display screen through a set of optical elements (such as lenses, reflectors, etc.) to achieve a clearer and more realistic visual experience. Its main function is to project the image signal on the display to the eyes through the optical system so that users can get an immersive feeling in the virtual reality environment. Optical modules usually include lenses, optical film layers, focusing systems, etc., and work closely with the resolution, field of view, distortion correction and other characteristics of the display screen to ensure that users can get distortion-free, clear and comfortable visual effects when wearing VR devices.
