## Abstracts

VR therapy, or virtual reality therapy, is an innovative method of psychotherapy and rehabilitation using virtual reality technology. By wearing a VR headset, patients can immerse themselves in a computer-generated, highly simulated three-dimensional environment and have a variety of customized interactive experiences. This therapy is widely used in the treatment of anxiety, phobias, post-traumatic stress disorder (PTSD), chronic pain management, and stroke rehabilitation. VR therapy can provide a safe and controllable exposure environment to help patients gradually face and overcome psychological barriers in virtual scenes, while promoting neuroplasticity and recovery of physical functions through multi-sensory stimulation of vision, hearing, and touch. Its advantages lie in its high sense of immersion and personalized treatment plans, which provide a powerful supplement and expansion to traditional therapies.

The global VR Therapy market size was estimated at USD 263.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
