Abstracts

Shared datacenter proxies are a type of proxy server hosted within data centers and shared among multiple users. These proxies act as intermediaries between a user's device and the internet, forwarding requests on behalf of the user and masking the user's original IP address. They are typically allocated from a pool of IP addresses managed by the proxy service provider. Since they are shared, multiple clients use the same set of IP resources, which can make them more cost - effective compared to dedicated proxies. Shared datacenter proxies can offer high - speed connectivity and reliable performance, enabling users to access websites and online services from different locations. However, due to their shared nature and the fact that they originate from data centers rather than residential networks, they may be more likely to be detected by websites as proxy connections, potentially leading to restrictions or blocks. They are commonly used for tasks such as web scraping, online advertising, and accessing geo - restricted content, where users seek anonymity, bypass restrictions, or conduct activities in a more private and flexible manner. Shared datacenter proxies refer to proxy servers that use IP resources in a shared - mode within a data center, which are cost - effective and widely used. With the continuous development of the global digital economy, the demand for data collection, network security, and anonymous access is increasing, which is expected to drive the growth of the market. Shared datacenter proxies are widely used in many fields. They are often used in data scraping to help enterprises collect a large amount of market data, competitor information, and consumer behavior data from the Internet; in the field of ad verification, they can be used to detect the authenticity and effectiveness of advertising, ensuring that advertising resources are not wasted; they are also used in some scenarios that require anonymous access, such as network security monitoring and bypassing regional restrictions. With the continuous emergence of new Internet applications, the demand for shared datacenter proxies in more application scenarios will continue to

increase. The demand for shared datacenter proxies varies from region to region. Developed regions such as North America and Europe, due to the high degree of digitalization, have a large number of Internet companies, financial institutions, and e-commerce enterprises, so the demand for shared datacenter proxies is relatively strong. In the Asia-Pacific region, with the rapid development of the digital economy, especially the booming development of the Internet, e-commerce, and fintech in countries such as China, India, and Southeast Asian countries, the market demand for shared datacenter proxies is also growing rapidly. The proxy service market is affected by policies and regulations. In some countries and regions, strict network security and privacy protection laws and regulations are implemented, which puts forward higher requirements for the operation and management of shared datacenter proxy service providers. For example, they need to ensure the legality of IP resources, protect user privacy, and prevent data leakage. This requires enterprises to continuously improve their compliance operation capabilities to adapt to the policy environment.

The global Shared Datacenter Proxies market size was estimated at USD 4629.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
