Abstracts

Vulcanized Pulley Lagging is a durable layer of material bonded to the surface of conveyor pulleys using a vulcanization process. This layer, typically made of rubber or other specialized compounds, enhances the friction between the conveyor belt and the pulley, improving traction, reducing slippage, and increasing the efficiency of the conveyor system. The vulcanization process ensures a strong, seamless bond, providing superior durability and resistance to wear, abrasion, and environmental conditions compared to mechanically applied lagging.

The global Vulcanized Pulley Lagging market size was estimated at USD 1397.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
