Abstracts

Chemical Mechanical Polishing is more commonly known as CMP Polishing. This is the process where the top surface of a wafer is polished with a slurry containing an abrasive grit, suspended within reactive chemical agents. The polishing action is partly mechanical and partly chemical. The mechanical element of the process applies downward pressure while the chemical reaction that takes place increases the material removal rate and this is usually tailored to suit the type of material being processed. The top 2 companies hold a share about 80%. Asia-Pacific is the largest market, with a share about 75%, followed by North America with the share about 13%.

The global Wafer Chemical Mechanical Polishing Machines market size was estimated at USD 2915.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
