Abstracts

In wafer fabrication facilities, the Computer Integrated Manufacturing (CIM) system serves as a critical software platform enabling high levels of automation and intelligence throughout the entire manufacturing process. By integrating data, equipment, processes, and personnel, the CIM system seamlessly connects disparate segments of production, thereby achieving efficient, precise, and controllable semiconductor manufacturing. It encompasses all stages of production?including material management, equipment control, process monitoring, and data analysis?providing robust support for production decision-making within semiconductor manufacturing plants. This report studies Computer Integrated Manufacturing (CIM) System in wafer fab. Wafer Fab Computer Integrated Manufacturing (CIM) System industry trends are defined by the evolution from fragmented CIM 1.0 to AI-driven CIM 3.0 architectures, featuring deep integration of multi-modal industrial large models and AgentNet collaborative networks for full-factory autonomous decision-making, modular system design to enable flexible deployment and cross-device interoperability, and a push toward full-stack independent and controllable solutions to reduce reliance on foreign systems, alongside AI-powered predictive maintenance, dynamic production scheduling, and real-time yield analysis that boosts equipment utilization and cuts downtime ; key opportunities lie in the surging demand from China?s expanding wafer fab capacity (driven by policies like Made in China 2025) which has become a global growth engine, the need for specialized CIM solutions for advanced 300mm wafer fabs and niche applications like Chiplet packaging, the accelerating domestic substitution of foreign-dominated high-end CIM systems, and the global demand for localized, secure CIM deployments (e.g., Southeast Asian fab sites replacing foreign systems for data sovereignty) ; however, the industry faces steep challenges including high technical barriers (requiring both software expertise and semiconductor process know-how with

long R&D cycles and high trial costs), systemic incompatibility issues , dominance of international giants that restrict market access for new entrants, risks from global technology export controls and supply chain dependencies on high-end sensors and industrial chips, difficulties in breaking into advanced 12-inch+ wafer fab high-end markets, data security and compliance risks from foreign server-based data storage, and soaring operational complexity (multi-system parallelization pushing maintenance costs to 15% of total production expenses with average fault response times of 4 hours for legacy setups) .

The global Wafer Fab Computer Integrated Manufacturing (CIM) System market size was estimated at USD 2961.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
