Report Overview

Semiconductor wafer fabrication is defined as process for production of photonic and electrical circuits which include LEDs, RF (radio frequency) amplifiers, and, optical computer components. Wafer fabrication helps in building components with required electrical structures. Wafer fabrication process is done for processing raw wafers to finished chips (discrete or integrated circuits). Traditional wafer fabrication process involves individual steps for resistors, transistors, conductors, and other electronic components processing on the semiconductor wafer. Semiconductor equipment plays a vital role in IC manufacturing which are located in fab, a manufacturing facility.

Factors such as growing demand from consumer electronics industry, and increasing technological advancements in telecom and semiconductor sector are expected to drive the demand for semiconductor wafer fab equipment market during the forecast period.

Other factors such as demand for silicon wafer, equipment footprint would help in analyzing semiconductor wafer fab equipment market in future. Moreover, innovation in wafer technologies which have led to “denser packaging” of devices such as MEMS (micro-electro-mechanical system) and transistors are expected to create foundation for new opportunities which can be leveraged by companies.
