Abstracts

The wafer film spreading machine is a highly specialized piece of semiconductor manufacturing equipment designed to apply uniform layers of photoresist or other polymeric films onto silicon wafers during integrated circuit fabrication. It operates through a precise spin-coating process, where a controlled amount of liquid material is dispensed onto a rotating wafer, utilizing centrifugal force to achieve thin, even coatings with minimal thickness variation. These machines are critical for photolithography, as coating uniformity directly impacts pattern resolution, yield, and device performance. Advanced models incorporate automation, real-time thickness monitoring, and compatibility with various substrate sizes and materials to meet stringent industry requirements for precision, contamination control, and throughput in nanoscale semiconductor production.

The global Wafer Film Spreading Machine market size was estimated at USD 325.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
