## Abstracts

Wafer level glass technology refers to the fabrication and integration of glass substrates at the wafer scale, enabling high-precision, miniaturized components primarily used in semiconductor packaging, microelectromechanical systems (MEMS), and advanced sensors. This technology leverages glass's advantageous properties such as excellent hermeticity, thermal stability, optical transparency, and compatibility with silicon to create interposers, through-glass vias (TGVs), and encapsulation layers that enhance device performance, reliability, and form factor. By processing glass in wafer formats, manufacturers achieve economies of scale, higher throughput, and improved alignment accuracy compared to piecewise handling, making it a critical enabler for next-generation electronics, biomedical devices, and photonics applications.

The global Wafer Level Glass Technology market size was estimated at USD 380.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
