Abstracts

A wafer-level packaged IR detector refers to an infrared detector produced by bonding a window wafer and a sensor wafer. Utilizing wafer packaging technology, which encapsulates the chips during the wafer manufacturing stage, multiple chips are simultaneously packaged onto a single wafer before being cut and tested. This process significantly enhances packaging efficiency and product consistency. Based on the thermal effect of infrared radiation, when infrared radiation strikes the sensitive material of the detector, the material's temperature changes, leading to alterations in its electrical properties. By detecting these changes in electrical properties, infrared radiation can be detected.

The global Wafer-level Packaged IR Detectors market size was estimated at USD 511.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
