Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Wafer-level TGV Substrate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global TGV Substrate production reached approximately 4,053 K Pcs, with an average global market price of around US\$ 30.4 per piece. TGV substrates, also known as through-glass via (TGV) substrates, are glass substrates with vertical electrical interconnects. Their core features are threefold: glass substrate, through-glass via technology, and metallization. The wafer-level TGV substrate uses high-quality borosilicate glass or quartz glass as the base material, and forms micro-vias with a diameter of usually 10-100um on the glass wafer through processes such as laser induction and etching. Then, through processes such as seed layer sputtering, electroplating filling, chemical-mechanical planarization, and redistribution layer (RDL) manufacturing, metal is filled in the vias to achieve 3D interconnection. The wafer-level TGV substrate is widely used in 3D integrated circuit packaging, MEMS (Micro - Electro - Mechanical System), biomedical, communication, sensor and other fields. For example, it can be applied to 5G/6G high - frequency chips such as ring resonators, waveguide slot antennas, millimeter - wave antennas, as well as new 3D packaging requirements for MEMS gyroscopes and accelerometers.

The global Wafer-level TGV Substrate market size was estimated at USD 123.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.20% during the forecast period.
