The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Wafer-Level Thin Film competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global wafer-level thin film production will reach 180,000 tons, with an average selling price of US\$1,700 per ton. Wafer-level thin films refer to thin layers of materials with specific thickness, composition and function deposited on the surface of the entire wafer (usually a silicon substrate), which are widely used in the manufacturing process of semiconductor devices, such as lithography, etching, doping, insulation, conduction and packaging. Such thin films are usually prepared by processes such as chemical vapor deposition (CVD), physical vapor deposition (PVD), atomic layer deposition (ALD), etc., and have excellent uniformity, thickness control accuracy and material properties. They are the key basis for realizing highly integrated and high-performance microelectronic devices.

The global Wafer-Level Thin Film market size was estimated at USD 256.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.10% during the forecast period.
