Abstracts

Wafer packaging materials refer to the specialized substrates, interposers, laminates, and protective films used to encapsulate and interconnect semiconductor wafers during the assembly and testing phases, ensuring mechanical stability, electrical performance, thermal management, and protection from environmental factors such as moisture, contaminants, and physical damage throughout the supply chain. These materials are critical for maintaining wafer integrity before dicing and are designed to meet stringent requirements for flatness, adhesion, thermal expansion compatibility, and electrical insulation to prevent defects and ensure high yield in advanced semiconductor manufacturing processes. The selection of appropriate packaging materials is influenced by factors such as wafer size, node technology, application-specific demands (e.g., high-frequency or power devices), and the growing need for materials that support heterogeneous integration and 3D packaging architectures.

The global Wafer Packaging Material market size was estimated at USD 3920.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
