## Abstracts

A wafer plasma dry strip machine is a device used in semiconductor manufacturing processes. It utilizes plasma technology to remove photoresist and other organic substances from the surface of wafers. Operating in a vacuum environment, it excites reactive gases into plasma via a radio frequency power supply. The active particles in the plasma then undergo physical and chemical reactions with the organic substances on the wafer surface, decomposing them into gaseous products that are subsequently exhausted, thus achieving surface cleaning and treatment of the wafers. It is characterized by high stripping efficiency, good selectivity, and minimal damage to wafers.

The global Wafer Plasma Dry Strip Machine market size was estimated at USD 612.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
