Report Overview

Before the wafer is thinned, a layer of adhesive film will be pasted on the front of the wafer. The function of this layer of film is to fix the chip on the front of the wafer, so that the grinding machine can grind the silicon wafer on the back of the wafer. Generally, the thickness of the silicon wafer before grinding is about 700 μ m. After grinding, the thickness of the wafer becomes 200 μ m, or even reaches the level of 120 μ m. It depends on the customer's requirements and the application environment of the chip, that is, the wafer thinning process. Wafer will stick a layer of film on the back of Wafer before slicing. The function of this film is to stick the chip on the film, which can keep the grain intact during the cutting process and reduce the chipping during the cutting process. Ensure that the die will not be displaced and dropped during the normal transfer process, that is, the scribing process in the post-chip packaging and testing process. A film used to fix Wafer and chip is used in chip thinning and dicing process. In the actual production process, this kind of film generally uses UV film and non-UV film (blue film)
