Abstracts

In the semiconductor process, the UV film and non-UV film used in wafers are also called UV tape and non-UV tape. Among them, non-UV tape is usually called blue film, which is mainly used in semiconductor grinding and cutting processes. Whether it is grinding tape or cutting tape, it includes non-UV tape (Non-UV Tape) and UV tape (UV Tape). Non-UV type is a general traditional pressure-sensitive tape. Considering the easy peeling, its adhesion is generally lower than that of UV type (before UV exposure), about 100~400 gf/25mm; UV tape is a pressure-sensitive tape with high adhesion strength before exposure. After exposure to UV light, its peeling force will be greatly reduced. It not only has strong fixation to the adherend, but also has the advantage of easy peeling after the process purpose is achieved. Wafer back grinding tape (BG Tape) mainly refers to the protection and fixation of the front circuit of the wafer during the back grinding and thinning after the wafer is completed, and prevents the damage of the front circuit of the wafer during the back grinding of the wafer. Dicing Tape is mainly used for fixing, cutting, expanding, UV debonding, and separation in semiconductor wafer and packaging processes. DAF film is used to bond chips and substrates during semiconductor packaging.

The global Wafer Uv Film And Non Uv Film Blue Film market size was estimated at USD 670.52 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
