Report Overview:

Waist high turnstiles are a type of pedestrian turnstile that is designed to control access to a facility by only allowing people to pass through one at a time. They are typically used in areas where security is not as critical as it would be in a full-height turnstile, such as office buildings, schools, and hospitals.

Waist high turnstiles are made up of two or three arms that are spaced apart to allow people to pass through. The arms are typically made of metal or plastic, and they are often covered with a decorative material.

Waist high turnstiles can be operated manually or automatically. Manual turnstiles require a person to insert a card or swipe a badge in order to unlock the arms. Automatic turnstiles use a sensor to detect when someone is approaching, and they automatically unlock the arms.

The Global Waist High Turnstiles Market Size was estimated at USD 164.32 million in 2023 and is projected to reach USD 200.82 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
