## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Walking Beam Conveyor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The walking beam conveyor is a device used for material transportation. It realizes intermittent forward conveying of materials through the periodic action of the walking beam. Its working principle is based on the four action cycles of the walking beam: rising, advancing, descending, and retreating. In the rising stage, the walking beam lifts the material to separate it from the support beam; in the forward stage, the material is moved forward a certain distance; in the descending stage, the material is placed on the support beam in front; in the retreat stage, the walking beam returns to the initial position and prepares for the next cycle. This conveying method can accurately control the conveying position and beat of the material, ensure the stability and accuracy of the material conveying, and is suitable for conveying materials of various shapes, sizes and weights.

The global Walking Beam Conveyor market size was estimated at USD 457.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
