Abstracts

Warm hot forging presses represent a specialized category of metal forming machinery designed to process metals at temperatures between room temperature and hot forging ranges, typically from 200°C to 800°C, combining the advantages of both cold and hot forging methods. These presses utilize controlled heating to reduce material strength and increase ductility, enabling the production of complex, high-precision components with improved mechanical properties and reduced energy consumption compared to traditional hot forging, while avoiding the excessive tool wear and limited formability associated with cold forging.

The global Warm Hot Forging Presses market size was estimated at USD 420.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
