Abstracts

Bleached clay is clay that has been bleached, usually using mechanical crushing and chemical bleaching. Among them, the chemical bleaching method is more commonly used. Its principle is to use strong oxidants (such as hydrogen peroxide, sodium hypochlorite, potassium permanganate, etc.) to oxidize the iron impurities in the reduced state into water-soluble ferrous ions, and then remove them by washing with water. . Bleaching clay can obtain a better bleaching effect in a neutral and slightly alkaline environment, and at the same time avoid the corrosion of equipment by acidic media, which has practical economic significance.
