Abstracts

Waste oil re-refining is a process that involves the purification and regeneration of used or contaminated lubricating oil to produce high-quality base oil that can be used to manufacture new lubricants. Lubricating oils, such as those used in engines and machinery, can become contaminated with impurities and lose their effectiveness over time. Rather than disposing of used oil, which can be environmentally hazardous, re-refining provides a sustainable and environmentally friendly way to recycle and reuse the oil. Continuous advancements in re-refining technologies are expected, with a focus on improving efficiency, reducing energy consumption, and enhancing the overall process. Innovations in distillation, hydro-treating, and solvent extraction methods may lead to more effective and sustainable re-refining processes.

The global Waste Oil Re-refining market size was estimated at USD 2530.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
