Report Overview

Getting rid of waste has become a challenge for the society, thereby affecting the safety and sustainability of the eco-system. If not handled carefully, garbage is either incinerated or stacked in different places, causing harm to the environment and the people. The traditional method that is used for separating waste not only increases the chances of health hazards to the human workforce but also gives rise to air, water, and soil pollution. Hence, recycling and reusing waste has become essential. Waste sorting robots are automated machines that are replacing the traditional ways of sorting waste. These robots are autonomous intelligent units deployed for waste processing and recycling in industries.

According to the report, one of the major drivers for this market is Use of robots for ensuring safety in waste sorting process. Safety in solid waste collection and separation is a major issue. Despite the adoption of the best safety practices, accidents and injuries to human workers can still occur in different processes involved in waste collection and separation. To reduce the risk of injuries and accidents, manufacturers are developing robots for collecting and sorting waste. Robots receive instructions from operating systems for heavy lifting, dumping of waste, and separating reusable materials from waste.
