Abstracts

Waste-to-energy (WtE) boilers are specialized thermal systems designed to combust municipal solid waste, industrial refuse, or biomass to generate steam or hot water, which can then be used for electricity production, district heating, or industrial processes. These boilers are engineered to handle heterogeneous and often challenging fuel sources, incorporating advanced emission control technologies to minimize environmental impact, such as flue gas cleaning systems to capture pollutants like dioxins, heavy metals, and particulate matter. By converting waste into useful energy, they play a dual role in waste management and renewable energy generation, reducing landfill dependency and greenhouse gas emissions while recovering valuable resources from refuse that would otherwise be discarded.

The global Waste To Energy Boilers market size was estimated at USD 2150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
