Abstracts

Waste tungsten recycling refers to the collection, processing, purification, and reuse of tungsten-containing scrap materials such as used cemented carbide tools, tungsten alloy offcuts, tungsten powder residues, and worn tungsten wires generated during industrial production and application. As a rare metal with a high melting point, tungsten is essential in sectors like hardmetals, aerospace, electronics, energy, and defense. Due to its scarcity and high mining cost, recycling holds both economic and strategic value. Recovery methods include physical separation, hydrometallurgy, thermal treatment, and high-temperature reduction, tailored to the waste type and impurity profile. Hydrometallurgical processes are especially efficient in producing high-purity ammonium paratungstate or tungsten oxide, which can then be reduced to metal powder for reuse.

The global Waste Tungsten Recycling market size was estimated at USD 970.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
