Abstracts

A sewage pumping station is an engineering facility used to pump and transport sewage in urban drainage projects. When the sewage in the sewage pipeline cannot be transported or discharged by gravity, or when the construction is difficult due to the deep burial of the general road, or when it is at the terminal of the main pipe and needs to be pumped up before it can enter the sewage treatment plant, a sewage pumping station must be installed. The sewage pumping station is an important part of the sewage system. It is characterized by continuous water flow and small water flow, but the change range is large, and the content of pollutants in the water is high. With the development of the national economy, the increase in industrial investment and supporting investment in water conservancy and municipal management, and industrial upgrading, industry demand is expected to increase steadily. Judging from the development plans of major downstream industries, downstream demand mainly involves new investment and technological transformation, such as focusing on the development of key equipment such as pumps and valves for special purposes, and research on new high-efficiency energy-saving water pumps and other energy-saving technologies. Research on the operation performance evaluation and energy-saving transformation technology of general equipment such as compressors, water pumps, and motors in industrial fields such as petroleum, chemical industry, and metallurgy.

The global Wastewater Pumping Stations market size was estimated at USD 1667.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
