Abstracts

Water atomised ferro silico is a granular alloy produced through the water atomisation process, where a molten mixture of iron (Fe) and silicon (Si) is rapidly cooled and solidified by high-pressure water jets, resulting in spherical or near-spherical particles with controlled size distribution and enhanced metallurgical properties. This method yields a product with improved homogeneity, reactivity, and flow characteristics compared to conventionally crushed ferro silico, making it particularly suitable for applications in steelmaking, where it is used as a deoxidizer and alloying additive to enhance steel quality, as well as in foundries for inoculating cast iron to improve graphite formation and mechanical properties. The atomised form's consistent particle size and reduced dust generation also contribute to safer handling, precise dosing, and increased efficiency in industrial processes.

The global Water Atomised Ferro Silico market size was estimated at USD 650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
