## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Water-based Anode Binder competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Water-based Anode Binder production reached approximately 150,000 tons with an average global market price of around US\$ 2,500 per tons, a single-line production capacity of approximately 500 tons/year, and a gross profit margin of approximately 20%-40%. A water-based anode binder is a polymeric binding material specifically designed to hold together active materials, conductive additives, and other components in the anode of lithium-ion and next-generation rechargeable batteries, using water as the main dispersion medium instead of organic solvents. In a typical slurry process, the water-based anode binder is dissolved or dispersed in water and mixed with graphite, silicon or silicon-carbon composites, conductive carbon, and other additives to form a homogeneous slurry, which is then coated onto a metal current collector (usually copper) and dried to create a mechanically robust and electrically stable electrode layer. Compared with solvent-based binders, water-based anode binders significantly reduce volatile organic compound (VOC) emissions, lower toxicity and flammability risks, and simplify solvent recovery and environmental compliance, thereby enabling greener and more cost-efficient electrode manufacturing.

The global Water-based Anode Binder market size was estimated at USD 375.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.00% during the forecast period.
