Abstracts

Water based fluorocarbon coatings mainly use water-based fluorocarbon resin as the film-forming substance, which contains a large number of F-C bonds. F-C bonds have a higher bond energy in chemical bonds than C-H bonds. The electron cloud of fluorine atoms has a stronger shielding effect on C-C bonds than hydrogen atoms. At the same time, due to the small covalent half diameter of fluorine atoms, it is difficult for reactants to insert, effectively protecting C-C bonds and making them difficult to be destroyed by heat, light, and chemical reactions. Water based fluorocarbon coatings are a type of environmentally friendly coating that uses water as a solvent and are widely used in the fields of steel structures and construction. In ordinary anti-corrosion coatings, solvents are still widely used. With the increasing emphasis on environmental protection and people's awareness of environmental protection, water-based coatings replacing solvent based coatings are the main trend in industry development.

The global Water Based Fluorocarbon Coating market size was estimated at USD 152.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
