Abstracts

Water-based fluoropolymer coatings are coatings that use water as the primary solvent or carrier for fluoropolymers, offering similar performance to solvent-based coatings but with reduced environmental and health risks. These coatings are preferred for their lower volatile organic compound (VOC) emissions, making them more environmentally friendly and safer for users. Powder coatings lack solvents, giving way to negligible volatile organic compound (VOC) emission into the atmosphere and reducing the risk of combustion during their usage and storage process. In addition, the powder can be easily washed when exposed to human skin, which reduces the risk of health problems for operators. ETFE is excellent in processability and able to form a thick and non-stick film layer with electrical, mechanical and chemical strength. FEP and PFA Coating Powder are low in melt viscosity and excellent in melt fluidity which can give a coating free of pinholes.

The global Water-based Fluoropolymer Coating market size was estimated at USD 643.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
