Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Water-based Isocyanate Curing Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Water-based isocyanate curing agent is a high-performance cross-linking agent with isocyanate group as the core reaction unit and dispersed in the water phase system. It is widely used in water-based coatings, water-based inks, water-based adhesives and other systems to enhance the system's cross-linking density and improve weather resistance and mechanical properties. Compared with traditional solvent-based isocyanate curing agents, waterborne isocyanates have lower volatile organic compound (VOC) emissions, are safer and more environmentally friendly, and are suitable for industrial occasions with high environmental protection requirements, such as automotive coatings, industrial anti-corrosion, wood furniture, textile coatings and other fields. It usually exists in the form of prepolymers or closed types. By adjusting parameters such as NCO content, water dispersion stability, and open time, it can achieve efficient crosslinking reactions with hydroxyl resins (such as acrylic acid, polyurethane, and waterborne epoxy) during use to form a dense and durable coating film. Modern water-based isocyanate curing agents also combine emulsion polymerization and nano-dispersion technology, have higher emulsion stability and better construction performance, and are one of the key additives for achieving high-performance, low-VOC water-based formulations.

The global Water-based Isocyanate Curing Agent market size was estimated at USD 291.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
