Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Water-based PAA (Polyacrylic Acid) Binders competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A binder is a material that can bind the positive and negative active materials, conductive agents, and current collectors of lithium batteries together. In the preparation process of lithium batteries, active materials (such as lithium iron phosphate for the positive electrode and graphite for the negative electrode) need to be tightly combined and form a coherent whole with conductive agents (such as carbon black) and current collectors (such as copper foil). The role of the binder is similar to glue, ensuring that the electrode materials maintain good contact and stability, preventing the active materials from falling off and powdering, thereby ensuring the performance and life of the battery. PAA stands for polyacrylic acid. Due to its unique bonding properties and good compatibility with silicon-based materials, PAA is gradually replacing traditional negative electrode binders and has great application potential. PAA is a water-based binder that uses water as a solvent. Compared with the traditional binder PVDF (which requires the toxic solvent NMP), it has better environmental protection, reduces the risk of environmental pollution, and has lower production costs.

The global Water-based PAA (Polyacrylic Acid) Binders market size was estimated at USD 714.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 30.00% during the forecast period.
