Abstracts

Water cooled air conditioners are a type of air conditioning system that utilizes water as a primary medium for heat rejection, operating by circulating water through a cooling tower where heat from the refrigerant is dissipated via evaporation, making them distinct from air cooled systems which rely solely on ambient air. These systems are valued for their higher energy efficiency, especially in hot climates where ambient temperatures reduce the effectiveness of air cooled condensers, and are commonly deployed in large commercial, industrial, and institutional settings such as office buildings, data centers, hospitals, and manufacturing plants due to their ability to handle substantial cooling loads with lower energy consumption and a smaller physical footprint compared to equivalent air cooled units.

The global Water Cooled Air Conditioner market size was estimated at USD 10250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
