Abstracts

Water cooled ice machines are refrigeration systems that utilize water as a cooling medium to remove heat generated during the ice-making process, typically employing a continuous flow or recirculating water system to condense refrigerant in the condenser coil, which results in higher energy efficiency compared to air-cooled models but requires a consistent water supply and drainage infrastructure. These machines are commonly used in high-capacity commercial and industrial settings such as hotels, restaurants, healthcare facilities, and food processing plants where high ice production demand, space constraints, or ambient temperature conditions make air-cooled systems less practical, though they involve higher water consumption and utility costs.

The global Water Cooled Ice Machine market size was estimated at USD 425.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
