Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Water-Cooled Open Chiller competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.A water-cooled open chiller is a refrigeration device that uses water as a cooling medium. Its core feature is the open circulation system design. This type of chiller is usually composed of core components such as a compressor, evaporator, condenser, and expansion valve, but the water system of the evaporator and condenser is not completely closed, and water circulation is required through auxiliary equipment such as an external water tank and a water pump. Its working principle is that the refrigerant absorbs heat from the water in the evaporator, and then releases the heat to the external cooling water (such as cooling tower circulating water) in the condenser after being pressurized by the compressor, thereby achieving continuous cooling. Compared with a closed system, an open chiller has a simpler structure, low initial investment, and convenient maintenance, but its energy efficiency is relatively low and it relies on external water quality management. Its advantage is that it can flexibly adapt to complex working conditions, but affected by environmental protection and energy efficiency policies, some markets are gradually being replaced by high-efficiency closed or variable frequency models.

The global Water-Cooled Open Chiller market size was estimated at USD 843.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.70% during the forecast period.
