Report Overview

A water cooled strand pelletizing system is a system designed to convert molten plastic into small, uniform pellets using water. The system consists of several components including a die head, cooling bath, and pelletizer. The extruded plastic is cooled by a stream of water, which solidifies the plastic into strands. These strands are then cut into small pellets by the pelletizer. The water used in the cooling process is then drained and recycled back into the system. Water cooled strand pelletizing systems are commonly used in the production of plastic products such as pipes, films, and packaging materials.
