### Report Overview

In general, disinfection systems work by dosing the water with a controlled amount of a chlorine or chlorine dioxide compound, which quickly inactivates or oxidises bacteria and virus which could otherwise cause infection or allow the proliferation of harmful pathogens, such as Legionella. Unlike chemical approaches to water disinfection, UV light provides rapid, effective inactivation of microorganisms through a physical process. When bacteria, viruses and protozoa are exposed to the germicidal wavelengths of UV light, they are rendered incapable of reproducing and infecting.
