Abstracts

Water-ground source heat pump system is an energy-efficient HVAC (heating, ventilation and air conditioning) solution that uses the stable temperature of the ground or water source to provide heating and cooling for buildings. The system exchanges heat energy with nature through a network of pipes buried underground (ground source) or a nearby body of water (water source). In winter, the heat pump extracts heat from the ground or water and transfers it to the building; in summer, it operates in reverse, transferring heat from the building to the ground or water. Compared with conventional heating and air conditioning systems, this system saves about 50% energy. It is a new type of air conditioning system that uses renewable energy and is energy-efficient and pollution-free. It can be widely used in buildings such as commercial buildings, public buildings, residential apartments, schools and hospitals.

The global Water-ground Source Heat Pump System market size was estimated at USD 8126.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.20% during the forecast period.
