### Report Overview

The water washing method separates CO<sub>2</sub> and CH<sub>4</sub> based on the different solubilities of different gases in water under a certain pressure. In actual projects, the methane recovery rate of the water washing process is generally high, which can reach more than 98%. The energy consumption is relatively low, and some H<sub>2</sub>S can also be absorbed. However, the foam in the water solvent must be scraped out in time, and water must be replenished regularly. At the same time, attention must be paid to Discharge the leaked water solvent after treatment. In addition, during the water solvent regeneration process, H<sub>2</sub>S will be discharged as waste gas, which needs to be treated before being discharged.
